Dear Hiring Manager,

Your recent launch of AstraPay's digital wallet in underserved markets caught my attention because reliable, low-friction payments can transform daily life. I've spent the last three years at Grab building QA and automation frameworks for GrabPay, and I see clear ways to contribute to AstraPay's product roadmap and backlog prioritization.

At Grab, I developed an AI-driven test automation suite that cut test creation time by 60% and delivered 22 production-ready scripts using Python, Appium, and Selenium. Working directly with product owners to translate feature specs into test cases taught me backlog grooming and sprint planning and how rigorous QA underpins scalable fintech services.

I've also owned full-stack features at CommerceOwl and on personal projects. I led A/B tests that boosted onboarding conversions by 32% while maintaining 95% code coverage in React, Next.js, and Vue.js. In TeaPOS, I built a multi-tenant SaaS platform with PostgreSQL and role-based access control, collaborating closely with designers on prototypes and ensuring each release met security and compliance checks.

Although I'm newer to dedicated product management, my agile experience has me comfortable maintaining backlogs, prioritizing user stories, and coordinating cross-functional launches. I'm eager to apply these skills along with my payment-domain QA background to help AstraPay refine its roadmap and deliver seamless features.

I welcome the chance to discuss how my blend of automation-driven QA, full-stack development, and user-centered testing can support AstraPay's goals. Thank you for your time and I look forward to speaking soon.

Sincerely,

Ahmad Fahrezi
